ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. It was supported by contributions from the Winegrowers of California, the California Raisin Advisory Board, and the California Table Grape Commission.

We express our gratitude to vintners, nurseries, County Commissioners, grapestake firms, Farm Advisors, and others who supplied us with the names of individuals who planted grapes during the year. We also express our appreciation to farm owners and operators who provided information to us on their individual operations. Their forthright cooperation was greatly appreciated.

The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices was appreciated and worthy of special attention. Finally, a special thanks goes to the field enumerators and office personnel whose efforts and diligence made this report possible.

May 1987

FOREWORD

Since 1969, the California Agricultural Statistics Service has recorded and published current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern were acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. The drastic changes during that time period have been tabulated and released in annual grape acreage publications with data showing varietal and geographic changes affecting the grape industry.

The need to keep abreast of new plantings and geographic changes has proven essential. It is also important to accurately monitor decreases in acreage due to removals, graftings, corrections, and planting failures. The acreages, varieties, locations, ages of removals and graftings are now of greater concern, than they were previously. The California Agricultural Statistics Service has compiled these acreage statistics for use by interested persons.

SURVEY METHODS

A questionnaire was mailed to vintners, grapestake suppliers, Farm Advisors, County Commissioners, and licensed nurseries to aid us in developing a list of new growers. Names which they supplied on the questionnaire were screened against current records to avoid duplication of operators and their acreage. After a list of new growers was developed, each grower was mailed a questionnaire on which they could record their acreage.

Following completion of the 1985 Survey, corrected questionnaires were used to update the fruit acreage master files. Changes, reflecting all information obtained from the previous Grape Acreage Survey, County Commissioners, and our own fruit acreage surveys, were used in the update. From these updated fruit acreage files, grape plantings for nearly 16,500 parcels and over 9,400 operators were transferred to the 1986 grape acreage questionnaires. Each farm's grape acreage was listed with information concerning grape variety, year of planting, vine counts, vine spacing, and net acreage at the location described on the questionnaire.

All known or latent operators of California vineyards, except in Napa and Sonoma counties, were mailed a questionnaire asking them to verify all data for their operations and to report all removals, graftings, and new plantings of grapevines. They were also asked to report the intended removals between the time of their report and the 1987 harvest. Information from all operators having 100.0 acres or more was obtained by telephone or personal interview if the mailed questionnaire was not returned. Also, 20 percent of those operators with acres between 50.0 and 99.0 were designated for follow-up telephone or personal interview if the mailed questionnaire was not returned. About 13 percent of the growers with acres between 20.0 and 49.9 and 10 percent of the growers with less than 20.0 acres were also subsampled in this manner. All fieldwork and telephoning were completed during March and April.

Acreage covered by mail returns and enumeration accounted for about 86 percent of the total grape acreage. The remaining acreage was estimated through expansion of ponrespondents.

Timing of the Survey was changed from summer to spring with the 1975 Survey. This was done to enable a more accurate accounting of removals. These summer surveys were primarily designed to record new plantings. Removal data for 1976 and later surveys were recorded by additional questions on the regular questionnaire. Removal data was collected in the 1975 Survey with a separate questionnaire. Grafting data was recorded by additional questions on the regular questionnaire beginning with the 1980 Survey.

DATA LIMITATIONS

General: This report provides acreage data at several levels of detail. The procedures used were designed to minimize the impact of sample variations on the results. However, users are cautioned that the figures provided at the level of finest detail are subject to more sample variation than those at an aggregate level. The highest level of precision will, of course, be found at the State level for all grapes and for the three grape types. Somewhat less precision should be attached to data provided for minor varieties. An extreme example would be for a single grower with a minor variety in a county. If he were drawn in the sample of nonrespondents, the expansion process would exaggerate the county acreage for that variety. Instances such as this were not frequent, and careful consideration was given to all aspects of each individual situation before estimates were made.

In most cases the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent. However, for most operations, the reported variety, acreage, and year planted were accepted as reported.

All varieties (except Flame Seedless table grapes in Riverside County where 90 percent of the acres are drip irrigated and bear substantially in the second year) are considered nonbearing for 3 years, i.e., acres planted in 1984 would not be bearing until 1987. Although in certain areas of the State some varieties produce a crop after 2 nonbearing years, production is not large enough to consider as full bearing.

In these situations, comparison of the current inventory of 1985 and earlier plantings with those published a year ago reveals differences. The current estimate of 1985 plantings is higher because the 1986 Survey accounted for acreage that was not included in the 1985 Survey and acreage grafted in 1986. Graftings on bearing acres are recorded as planted in the previous year, i.e., French Colombard grafted in 1986 onto 1975 planted Barbera is recorded as planted in 1985. Other factors affecting data for all years are variations due to sampling procedures and changes by growers in acreage, variety, and year planted information reported in earlier surveys. Total acreage planted in 1986 could increase from 6,256 acres reported now to 9,000 acres by next year's survey due to historic data reporting lags and graftings. Also, a noticeable amount of abandoned acreage from past year plantings were brought back into production. This accounts for some of the changes in acreages for the past few years.

Graftings for the year 1985-86 consist of acreage grafted between October 1985 and September 1986. The year 1986-87 is estimated graftings from October 1986 through March 1987. Starting with the 1982 Grape Acreage Survey, reported graftings for 1982-83 are adjusted to represent growers not contacted during the Survey. These graftings are not comparable to previous years where only actual reported graftings were shown in the table. Estimated graftings will be comparable from 1982-83 forward. This change does not affect other data in this report.

The 1986 Raisin Industry Diversion Program (RID) administered by the Raisin Administrative Committee, allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a 1986 crop. These acreage changes were handled in the following manner. Acreage that was pruned but not pulled was still included in bearing acreage. This was done because pruned acreage would still be capable of production in 1987 provided the acreage was not again enrolled in the 1987 RID Program. Acreage that was removed because of the RID Program was included in removals for 1985-86 and was not included in the bearing acreage for 1986.

<u>Varieties:</u> Data are provided for each variety with 50 or more total acres standing in 1986. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 94 varieties including 56 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

Footnotes detailing synonymous varietal names are explained on page 35.

Rootstock: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock is budded over, the year of planting assigned to that block of grapes is the year preceding the budding. For instance, if a 1982 rootstock planting is budded over in 1986, the year of planting assigned to the selected variety would be 1985.

<u>Period Covered</u>: The primary intent of the 1986 project was to record removals of grapes since the 1985 harvest and new plantings of grapes during 1986. Acreage abandoned in 1986 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1985 and 1986 harvests. In 1971 and 1972, we collected planting information on a July 1 to June 30 basis. Because of increased planting activity after mid-year since 1971, and because of many requests from data users, we changed to a calendar-year basis for plantings with the 1973 report. For the 1973 and subsequent reports, growers were asked to report grapes actually planted during the year up to the time of their report and in addition, plantings intended to be made prior to the end of the year. No effort will be made to resolve inconsistencies with inventories published in those earlier reports.

ACREAGE BREAKDOWN

California grape acreage is estimated at 701,872 acres, the lowest since 1980 when acreage was 683,992. Raisin variety grapes have declined to 280,868 acres, down from the 1984 record high 294,716 acres. Red wine type grape acreage of 140,133 acres for 1986 is the lowest noted acreage in the past 15 years.

Fresno continues to lead the State in total planted grapes and Raisin type grapes with 209,227 and 163,147, respectively. Tulare County has the highest acreage planted in table type grapes with 26,080 acres. San Joaquin leads in the red wine type category with 21,451 acres while Madera is estimated at 25,772 acres for white wine type grapes.

Thompson Seedless grapes of 269,059 acres represent 96 percent of the raisin type acreage. Fresno County controls the largest portion with 157,633 acres. Flame Seedless has the largest table type acreage planted with 19,902 acres and Flame Tokay next at 18,209 acres. Winfandel grapes hold the most acreage of red wine type grapes at 25,797 acres. French Colombard grapes represent 37 percent of the white wine type with 69,713 acres.

Total estimated removals for the 1985-86 season are recorded at 29,520 acres, the highest reported removals ever for one season. Thompson Seedless grapes had the most removals with 10,756 acres. Total reported removals for Fresno County are 7,468 acres with raisin type grapes representing 77 percent of that acreage.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by the California Wine Commission, the California Raisin Advisory Board, and the California Table Grape Commission. We express our gratitude to vintners, nurseries, County Agricultural Commissioners, grapestake firms, Farm Advisors and others who supplied the names of individuals who planted grapes during the year. The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the field enumerators and office personnel whose efforts and diligence makes this report possible.

FOREWORD

Since 1969, the California Agricultural Statistics Service has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since that time.

SURVEY METHODS

Parcel records for California fruit crops are maintained by the California Agricultural Statistics Service. Updates are made to this database as information is received from on-going surveys, County Agricultural Commissioners and fruit acreage surveys conducted from this office on a rotating basis.

In addition, vinters, grapestake suppliers, Farm Advisors, County Agricultural Commissioners and licensed nurseries are asked annually to aid us in developing a list of new growers. Names which they supplied were screened against current records to avoid duplications of operators and acreage.

From the above sources, questionnaires were mailed to over 9,400 operators with nearly 16,500 grape acreage parcels. Each questionnaire was computer generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. They were also asked to report the intended removals between the time of their report and the 1988 harvest. Information from all operators having 100 acres or more was obtained by telephone or personal interview if the mailed questionnaire was not returned. Also, 20 percent of those operators with 50 to 99 acres were designated for follow-up telephone or personal interview. About 13 percent of the growers with acres between 20 to 49 and 10 percent of the growers with less than 20 acres were also subsampled in this manner. A follow-up was completed during March and April.

About 86 percent of the total grape acreage was reported in the current survey. This data was expanded to estimate for nonrespondents.

May 1988

DATA LIMITATIONS

General: This report provides acreage data at several levels of detail. Users are cautioned that the figures provided at the level of finest detail are subject to more sample variation than those at an aggregate level. The highest level of precision will, of course, be found at the State level for all grapes and for the three grape types. Less precision should be attached to county data provided for minor varieties. An extreme example would be for a single grower with a minor variety in a county. If he were drawn in the sample of nonrespondents, the expansion process would exaggerate the county acreage for that variety. Instances such as this were not frequent, and careful consideration was given to all aspects of each individual situation before estimates were made.

In most cases the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

Bearing and Non-bearing Acreage: For purposes of this publication, all varieties are considered nonbearing for 3 years; i.e.; acres planted in 1985 would not be bearing until 1988. The only exception is Flame Seedless table grapes in Riverside County where 90 percent of the acres are drip irrigated and bear substantially in the second year. Some varieties in other areas produce a crop after 2 nonbearing years, but production is not large enough to consider as full bearing.

<u>Grafting:</u> Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1987 onto a 1975 variety is recorded as planted in 1986. Graftings for the year 1986-87 consist of acreage grafted between October 1986 and September 1987. Likewise, graftings for 1987-88 are from October 1987 through March 1988.

Raisin Industry Diversion Program: The 1987 Raisin Industry Diversion (RID) Program, administered by the Raisin Administrative Committee, allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a 1987 crop. This acreage was handled in the following manner. Acreage that was pruned but not pulled was still included in bearing acreage. This was done as pruned acreage would still be capable of production in 1988 provided the acreage was not again enrolled in the 1988 RID Program. Acreage that was removed because of the RID Program was included in removals for 1986-87 and was not included in the bearing acreage for 1987.

<u>Varieties</u>: Data are provided for each variety with 50 or more total acres standing in 1987. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 94 varieties including 56 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

Footnotes detailing synonymous varietal names are explained on page 34.

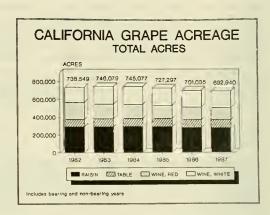

Rootstock: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1983 rootstock planting was budded over in 1987, the year of planting assigned to the selected variety was 1986.

<u>Period Covered:</u> The primary intent of the 1987 survey was to record removals of grapes since the 1986 harvest and new plantings of grapes during 1987. Acreage abandoned in 1987 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1986 and 1987 harvests.

California's 1987 total grape acreage is estimated at 693,841 acres. This is down 8,031 acres from the 1986 total of 701,872 acres and is the first time total grape acreage has fallen below the 700,000 acre level since 1980.

Wine type grapes total 323,533 acres, down 4,244 acres from 1986. Wine type grapes represent 46.6 percent of the total grape acreage. Raisin type varieties total 276,998 acres, down only 1.4 percent. Raisin type grapes account for 39.9 percent of the total grape acreage. Table type grapes total 92,409 acres, virtually unchanged from 1986. Table types maintain 13.3 percent of the total grape acreage. Rootstock is estimated at 901 acres.

Fresno County leads the State in total planted grapes and raisin type grapes with 207,235 acres and 162,308 acres, respectively. Tulare and Kern counties lead in table type grapes planted with 24,933 acres and 22,129 acres, respectively, which represents 51 percent of the total table type grapes. San Joaquin continues to lead in red wine type grapes with 19,585 acres while Madera heads the white wine type category with 25,744 acres.

CALIFORNIA GRAPE ACREAGE TOTAL ACRES RAISIN 276,999 40% 20% 7ABLE 92,409 20% RED WINE 137,686 RED WINE 135,647

Thompson Seedless grapes represent 96 percent of the raisin type grapes estimated at 266,061 acres. Fresno has nearly 60 percent of the acreage. Flame Seedless grapes total 21,567 acres which is the largest table variety. Zinfandel and Cabernet Sauvignon are the leading red wine grapes with 27,083 acres and 24,388 acres, respectively. French Colombard grapes represent the largest white wine type grapes with 69,321 acres.

Total removals for the 1986-87 season are 36,968 acres, higher than the 1985-86 previous record of 29,520 acres. Thompson Seedless had the most acres removed with 7,005 acres. Total reported removals for Kern County are 8,624 acres with wine type grapes representing 68 percent of that acreage.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by the California Wine Commission, the California Raisin Advisory Board, and the California Table Grape Commission. We express our gratitude to vintners, nurseries, County Agricultural Commissioners, grapestake firms, Farm Advisors and others who supplied the names of individuals who planted grapes during the year. The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the field enumerators and office personnel whose efforts and diligence makes this report possible.

Agricultural Statisticians

FOREWORD

Since 1969, the California Agricultural Statistics Service has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Petween 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since that time.

SURVEY METHODS

Parcel records for California fruit crops are maintained by the California Agricultural Statistics Service. Updates are made to this database as information is received from on-going surveys, County Agricultural Commissioners and fruit acreage surveys conducted from this office on a rotating basis.

In addition, vintners, grapestake suppliers, Farm Advisors, County Agricultural Commissioners and licensed nurseries are asked annually to aid us in developing a list of new growers. Names which they supplied were screened against current records to avoid duplications of operators and acreage.

From the above sources, questionnaires were mailed to over 9,200 operators with over 16,200 grape acreage parcels. Each questionnaire was computer-generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. They were also asked to report the intended removals between the time of their report and the 1988 harvest. Information from all operators having 100 acres or more was obtained by telephone or personal interview, if the mailed questionnaire was not returned. Also, 20 percent of those operators with 50 to 99 acres were designated for follow-up telephone or personal interview. About 13 percent of the growers with acres between 20 to 49, and 10 percent of the growers with less than 20 acres, were also subsampled in this manner. A follow-up was completed during March and April.

DATA LIMITATIONS

GENERAL: This report provides acreage data at several levels of detail. Users are cautioned that the figures provided at the level of finest detail are subject to more sample variation than those at an aggregate level. The highest level of precision will be found at the State level for all grapes and for the three grape types. Less precision should be attached to county data for minor varieties.

In most cases the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND MONBEARING ACREAGE</u>: For purposes of this publication, all varieties are considered nonbearing for 3 years; i.e.; acres planted in 1986 would not be bearing until 1989. The only exception is Flame Seedless table grapes in Riverside County where 90 percent of the acres are drip irrigated and bear substantially in the second year. Some varieties in other areas produce a crop after 2 nonbearing years, but production is not large enough to consider as full bearing.

<u>GRAFTING:</u> Graftings on bearing acres are recorded as planted in the previous year; i.e., Chardonnay grafted in 1988 onto a 1975 variety is recorded as planted in 1987. Graftings for the year 1987-88 consist of acreage grafted between October 1987 and September 1988. Likewise, graftings for 1988-89 are from October 1988 through March 1989.

<u>RAISIN INDUSTRY DIVERSION PROGRAM</u>: The 1988 Raisin Industry Diversion (RID) Program, administered by the Raisin Administrative Committee, allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a 1988 crop. This acreage was handled in the following manner. Acreage that was pruned but not pulled was still included in bearing acreage. Acreage that was removed because of the RID Program was included in removals for 1987-88 and was not included in the bearing acreage for 1988.

VARIETIES: Data are provided for each variety with 50 or more total acres standing in 1988. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 93 varieties including 55 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

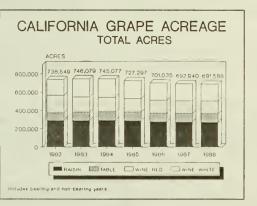

Footnotes detailing synonymous varietal names are explained on page 36.

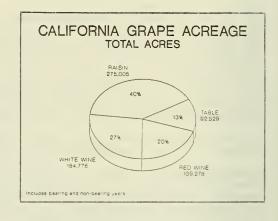

ROOTSTOCK: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1984 rootstock planting was budded over in 1988, the year of planting assigned to the selected variety was 1987.

<u>PERIOD COVERED</u>: The primary intent of the 1988 survey was to record removals of grapes since the 1987 harvest and new planting of grapes during 1988. Acreage abandoned in 1988 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1987 and 1988 harvests.

California's 1988 total grape acreage is estimated at 692,612 acres. This forecast is down 1,229 acres from the 1987 total of 93,841 acres. This is the third time in the .980's the estimate has been below 700,000 cres. Wine type grapes totaled 324,054 acres, slightly above 1987 acreage of 323,533 acres. Wine type grapes represent the major type of grape with 46.8 percent of the total grape acreage. Raisin type varieties totaled 275,005 acres, down 1,993 acres from 1987 creage. Raisin type grapes account for 39.7 percent of the total grape acreage. Table type grapes totaled 92,529 acres, up 120 acres from last season. Table type grapes represent 3.4 percent of the total grape acreage. Rootstock forecast is 1,024 maintaining slightly over 0.1 percent of total grape acreage for the State.

Presno county continues to lead the State in total planted grapes and raisin type grapes with 207,052 acres and 161,992 acres, respectively. Tulare and Kern counties lead in table type grapes planted with 24,851 acres and 22,257 acres, respectively. These two counties account for nearly 51 percent of total table grape acreage. San Joaquin county cemains the leader in red wine type grapes with 20,387 acres planted. Madera county continues to lead white wine type grapes with 25,238 acres planted.

Thompson Seedless grapes represent over 96 percent of the raisin type grapes estimated at 264,802 acres. Fresno County dominates raisin type grapes with 59 percent of the acreage. Flame Seedless grapes totaled 23,765 acres, which is the largest table variety. Zinfandel and Cabernet Sauvignon are the leading red wine grapes with 30,735 acres and 26,404 acres, respectively. French Colombard grapes represent nearly 36 percent of the white wine acreage with 66,029 acres.

Total removals for the 1987-88 season are 23,738 acres. Thompson Seedless had the most acreage removed with 5,647 acres. Total removals for Tulare County were 5,039 acres, which leads the State in removals. Total graftings for the 1987-88 season were 8,144 acres, up 62 percent from last season. Most of the graftings are represented in the wine category.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by the California Wine Commission, the California Raisin Advisory Board, and the California Table Grape Commission. We express our gratitude to vintners, nurseries, County Agricultural Commissioners, grapestake firms, Farm Advisors and others who supplied the names of individuals who planted grapes during the year. The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

JIM TIPPET State Statistician DAVE KLEWENO Agricultural Statistician

RON RADENZ Deputy State Statistician SUSAN SABATIER Research Analyst

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

Parcel records for California's fruit and nut crops are maintained by CASS. Updates are made to the CASS database as information is received from on-going surveys, County Agricultural Commissioners and CASS County Fruit Acreage surveys.

In preparation for the Grape Acreage Survey, vintners, grapestake suppliers, Farm Advisors, County Agricultural Commissioners and licensed nurseries are asked annually to assist CASS in developing a list of new growers. Names which they supplied were screened against current records to avoid duplication of operators and acreage.

From the above sources, questionnaires were mailed to 7,980 operators having slightly over 15,000 grape acreage parcels. Each questionnaire was computer-generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. They were also asked to report the intended removals between the time of their report and the 1990 harvest. If an operator with 50 acres or more did <u>not</u> return the mailed questionnaire, the information was obtained by telephone or personal Interview. This follow-up was completed during March and April, with an overall response rate of approximately 95 percent for the large growers. Those operators with less than 50 acres of grapes did not receive any follow-up contact if they did not return their questionnaire. <u>aa</u>/ Growers with less than 50 acres only account for 16 percent of the total grape acreage. Approximately 55 percent of these smaller growers returned their forms, and for the remaining 45 percent we assumed no changes occurred in their operation.

DATA LIMITATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for the three grape types (raisin, table, and wine). Less precision exists in the county data for minor varieties.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND NONBEARING ACREAGE</u>: For purposes of this publication, all varieties are considered nonbearing for 3 years; i.e., acres planted in 1987 would not be bearing until 1990. The only exception is Flame Seedless table grapes in Riverside County where 90 percent of the acres are drip irrigated and bear substantially in the second year. Some varieties in other areas produce a crop after 2 nonbearing years, but production is not large enough to consider as full bearing.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1988 onto a 1975 variety is recorded as planted in 1987. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

RAISIN INDUSTRY DIVERSION PROGRAM: 1988 was the last crop year that the Raisin Administrative Committee administered the Raisin Industry Diversion Program. This program allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a crop. This program was not in operation during the 1989 season.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1989. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 94 varieties including 54 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

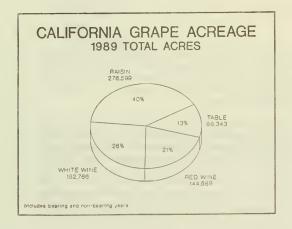

A footnote detailing synonymous varietal names are explained on page 33.

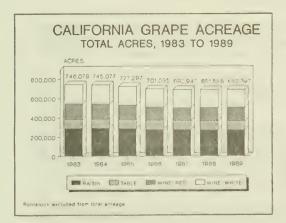

ROOTSTOCK: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1984 rootstock planting was budded over in 1988, the year of planting assigned to the selected variety was 1987. (See the above paragraph on graftings.)

<u>PERIOD COVERED</u>: The primary intent of the 1989 survey was to record removals of grapes since the 1988 harvest and new planting of grapes during 1989. Acreage abandoned in 1989 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1988 and 1989 harvests.

ACREAGE BREAKDOWN

California's 1989 total grape acreage is estimated at 693,465 acres. This estimate is up 853 acres from the 1989 total of 692,612 acres. This is the fourth time in the 1980's the estimate has been below 700,000 acres. Wine type grapes totaled 327,455 acres, up 3,401 acres from the 1988 acreage of 324,054 acres. Wine type grapes represent 47.2 percent of the total grape acreage. Raisin type varieties totaled 276,599 acres, up 1,594 acres from 1988 acreage. Raisin type grapes account for 39.9 percent of the total grape acreage. Table type grapes totaled 88,343 down 4,186 acres from last season. Table type grapes account for 12.7 percent of the total grape acreage. The rootstock forecast is 1,068 acres, maintaining slightly over 0.1 percent of total grape acreage for the State.

Fresno County continues to lead the State in total planted grapes and raisin type grapes with 208,575 acres and 164,421 acres, respectively. Tulare and Kern counties lead in table type grapes planted with 23,056 acres and 22,017 acres, respectively. These two counties account for 51 percent of total table grape acreage (same percent as last year). San Joaquin County remains the leader in red wine type grapes with 22,002 acres. Madera County continues to lead white wine type grapes with 25,059 acres.

Thompson Seedless grapes, estimated at 267,168 acres, continue to represent over 96 percent of the raisin type grapes. Fresno County dominates raisin type grapes with 59 percent of the acreage. Flame Seedless grapes totaled 24,745 acres, which is the largest table variety. Zinfandel and Cabernet Sauvignon are the leading red wine grapes with 33,305 acres and 29,668 acres, respectively. These two varieties account for 44 percent of the red wine type grapes planted in the State. French Colombard grapes represent 34 percent of the white wine acreage with 62,326 acres.

Total removals for the 1988-89 season were 21,070 acres. Thompson Seedless again had no nost acreage removed with 3,469 acres. Chardom 9, which is escond largest variety pulled out with 2,583 acr. In there yand Fresno counties led the State in remo as with 3,153 and 3,143 acres, respectively. Santa Barbha and Tulare counties were a close second in removals with 2,895 and 2,880 acres, respectively. Total graftings for the 1988-89 season were 10,000 acres, up 23 persont from last season. Ninety-two percent of these vines were grafted over to wine varieties.

ACREAGE TRIENDS

While the overall acreage is vitually unchanged from last year (an increase of less that 1 pincent), the amount of bearing acreage decreased by percent from 654,685 to 642,106 acres and the nor bit is uggested by 35 percent from 37.9 this suggests that old vines are being provided by the suggest of simply plinting in the suggest old ones.

This trend is particularly in the mpson Seedless raisin grapes. The document of the mass of the seedless raisin grapes. The document of the mass of the seedless raisin grapes. The document of the mass of the ma

Three red wine varieties als. In d substantial increases in non-bearing acreage as or policy of their total acreage. Cabernet Sauvignon, Merlot and Zinfandel grapes. These three varieties plus Thompson Seedless account for 55 percent of the Increase in non billing acreage.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by the Wine Institute, the California Raisin Advisory Board, and the California Table Grape Commission. The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

Parcel records for California's fruit and nut crops are maintained by CASS. Updates are made to the CASS database as information is received from on-going surveys, County Agricultural Commissioners and CASS County Fruit Acreage surveys.

Questionnaires were mailed to 7,828 operators having slightly over 15,000 grape acreage parcels. Only operators with five or more acres of grapes received a questionnaire. Each questionnaire was computer-generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. They were also asked to report the intended removals between the time of their report and the 1991 harvest. If an operator with 50 acres or more did <u>not</u> return the mailed questionnaire, the information was obtained by telephone or personal interview. This follow-up was completed during March and April, with an overall response rate of approximately 95 percent for the large growers. Those operators with less than 50 acres of grapes did not receive any follow-up contact if they did not return their questionnaire. <u>aa</u>/ Growers with less than 50 acres only account for 16 percent of the total grape acreage. Approximately 63 percent of these smaller growers returned their forms, and for the remaining 37 percent we assumed no changes occurred in their operation.

DATA LIMITATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for the three grape types (raisin, table, and wine). Less precision exists in the county data for minor varieties.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND NONBEARING ACREAGE</u>: For purposes of this publication, all varieties are considered nonbearing for 3 years; i.e., acres planted in 1988 would not be bearing until 1991. The only exception is Flame Seedless table grapes in Riverside County where 90 percent of the acres are drip irrigated and bear substantially in the second year. Some varieties in other areas produce a crop after 2 nonbearing years, but production is not large enough to consider as full bearing.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1988 onto a 1975 variety is recorded as planted in 1987. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

RAISIN INDUSTRY DIVERSION PROGRAM: 1988 was the last crop year that the Raisin Administrative Committee administered the Raisin Industry Diversion Program. This program allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a crop. This program was not in operation during the 1989 or 1990 seasons.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1990. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 93 varieties including 53 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

Footnote c/ on page 34 lists synonymous varietal names.

<u>ROOTSTOCK</u>: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1984 rootstock planting was budded over in 1988, the year of planting assigned to the selected variety was 1987. (See the above paragraph on graftings.)

<u>PERIOD COVERED</u>: The primary intent of the 1990 survey was to record removals of grapes since the 1989 harvest and new planting of grapes during 1990. Acreage abandoned in 1990 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1989 and 1990 harvests.

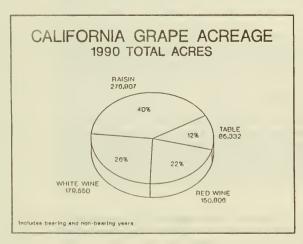

ACREAGE BREAKDOWN

California's 1990 total grape acreage is estimated at 693,627 acres. This estimate is up 162 acres from the 1989 total of 693,465 acres. Wine type grapes totaled 330,356 acres, up 2,901 acres from the 1989 acreage of 327,455 acres. Wine type grapes represent 47.6 percent of the total grape acreage. Raisin type varieties totaled 276,907 acres, up 308 acres from 1989 acreage. Raisin type grapes account for 39.9 percent of the total grape acreage. Table type grapes totaled 85,332 acres, down 3,011 from last season. Table type grapes account for 12.3 percent of the total grape acreage. The rootstock forecast is 1,032 acres, maintaining slightly over 0.1 percent of total grape acreage for the State.

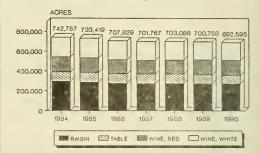

Fresno County continues to lead the State in total planted grapes and raisin type grapes with 208,292 acres and 165,103 acres, respectively. Tulare and Kern counties lead in table type grapes planted with 22,464 acres and 22,304 acres, respectively. These two counties account for 52 percent of total table grape acreage. San Joaquin County remains the leader in red wine type grapes with 22,667 acres. Madera County continues to lead white wine type grapes with 24,633 acres. (See illustration next page.)

Thompson Seedless grapes, estimated at 267,258 acres, continue to represent over 96 percent of the raisin type grapes. Fresno County dominates raisin type grapes with 60 percent of the acreage. Flame Seedless grapes totaled 25,069 acres, which is the largest table variety. Zinfandel and Cabornet Sauvignon are the leading red wine grapes with 34,163 acres and 33,206 acres, respectively. These two varieties account for 45 percent of the red wine type grapes planted in the Stete. French Colombard grapes represent 33 percent of the white wine acreage with 58,888 acres, while Cherdonnay is catching up with 29 percent of the white wine acreage.

Total removals for the 1989-90 season were 12,793 acres. Thompson Seodless again had the most acreage removed with 2,091 acres. French Colombard was the second largest variety pulled out with 1,739 acres. Tulare County led the State in removals with 2,436 acres. Total graftings for the 1989-90 season were 4,014 acres, down 60 percent from last season. Seventy-two percent of these vines were grafted over to wine varieties.

CALIFORNIA GRAPE ACREAGE TOTAL ACRES, 1984 TO 1990

Includes bearing and non-bearing years

ACREAGE TRENDS

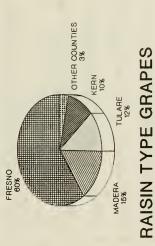

Raisin type grapes increased a total of 308 acres from last year. The major varietal changes include an increase of 500 acres for the Fiesta variety, an increase of 177 acres in Black Corinth raisin grapes, a decrease of 464 acres for the Muscat of Alexandria variety, and an inconsequential increase of 90 acres in Thompson Seedless grapes.

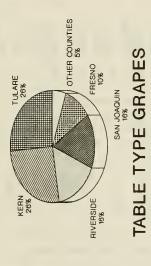

Table type grapes decreased an overall of 3,011 acres. Most of this decline can be attributed to the following five varieties: Emperor with a loss of 1,461 acres; Flame Tokay declining 1,236 acres; Perlotte and Ruby Seedless with declines of 487 and 481 ecres, respectively; and Ribier with a loss of 458 acres. Counterocting this overall decline was an increase of 1,002 acres in Redglobe grapes and a smaller increase of 324 acres for the Flame Seedless variety.

Red wine type grepes increased a total of 6,117 acres from last year. The largest increase was seen in Cabernet Sauvignon grapes with an additional 3,538 acres. The following four vorieties also increased moderately: Merlot with an additional 1,903 acres; an 858 acre increase for Zinfandel grapes; and increases in the Grenache and Prinot Noir verieties of 488 and 409 ecres, respectively. Carignane grapes had the largest decline with 593 acres.

White wine type grapes decreesed on overall of 3,216 acres. The largest declines were seen in French Colombard with 3,438 ecres, Chenin Blanc with 1,617 acres, and White Riesling with 1,022 acres. Additional smaller declines occurred in Sauvignon Blanc and Gewurztraminer verieties with 364 and 249 acres, respectively. Only the Chardonney variety increased substantially with 4,108 acres.

FOOTNOTES

Survey follow-up procedures were modified starting with crop year 1989, placing emphasis on operations with 50 plus acres. Nonbearing includes plantings for 1988, 1989 and 1990. See footnote b/ below.

Nonbearing includes plantings for 1988, 1989 and 1990. See footnote by Delow.
Table grape variety Flame Seedless begins bearing after two nonbearing years in Riverside County where drip irrigation is used.
Common names: Black Corinth/Zante Currant, Canner/Thompson Canners/Canner Seedless, Beauty Seedless/Black Beauty, Black
Prince/Rose of Peru, Malaga/White Malaga, Red Crimson/Crimson Seedless, Redglobe/Rose Ito, Ruby Seedless/King Ruby, Gamay/Napa
Gamay, Mataro/Mouvedre, Sangioveto/Sangiovete, Syrah/French Syrah/Shiraz, Muscat Blanc/Muscat Canelli, Palomino/Golden Chasselas,
St. Emilion/Ugni Blanc/Trebbiano, Sylvaner/Franken Riesling, White Riesling/Johannisberg Riesling.
Reported postharvest removals October 1990 through September 1990.
Reported postharvest removals October 1990 through March 1991.

Reported postharvest intended removals April 1991 through September 1991.

Reported postharvest removals October 1990 through March 1991 plus reported postharvest intended removals April 1991 through September 1991. The total figure accounts for approximately one-third of the acreage removed this season. The number will be revised next year.

Reported postharvest graftings October 1989 through September 1990.

Reported postharvest graftings October 1990 through March 1991.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by the Wine Institute, the California Raisin Advisory Board, and the California Table Grape Commission. The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

JIM TIPPET State Statistician

TOM MCNAIR
Agricultural Statistician

RON RADENZ DWAINE NELSON Deputy State Statisticians

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

Parcel records for California's fruit and nut crops are maintained by CASS. Updates are made to the CASS database as information is received from on-going surveys, County Agricultural Commissioners and CASS County Fruit Acreage surveys.

Questionnaires were mailed to approximately 7,800 operators having slightly over 15,000 grape acreage parcels. Only operators with five or more acres of grapes received a questionnaire. Each questionnaire was computer-generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. They were also asked to report the intended removals between the time of their report and the 1992 harvest. If the questionnaire was not returned by mail, the information was obtained by telephone or personal interview.

DATA LIMITATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for the three grape types (raisin, table, and wine). Less precision exists in the county data for minor varieties.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND NON-BEARING ACREAGE</u>: For purposes of this publication, all varieties are considered non-bearing for 3 years; i.e., acres planted in 1988 would not be bearing until 1991. The only exception is Flame Seedless table grapes in Riverside County where drip irrigation is used. As a result, these grapes bear substantially in the second year. Some varieties in other areas produce a crop after 2 non-bearing years, but production is not large enough to consider as full bearing.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1988 onto a 1975 variety is recorded as planted in 1987. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

RAISIN INDUSTRY DIVERSION PROGRAM: In 1991 the Raisin Administrative Committee administered the Raisin Industry Diversion Program. This program allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a crop. This program was not in operation during the 1989 or 1990 seasons.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1991. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 90 varieties including 52 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

Footnote c/ on page 33 lists synonymous varietal names.

<u>ROOTSTOCK</u>: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1984 rootstock planting was budded over in 1988, the year of planting assigned to the selected variety was 1987. (See the above paragraph on graftings.)

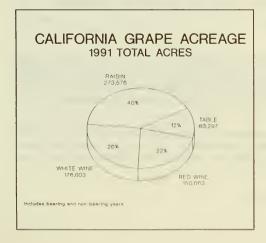

<u>PERIOD COVERED</u>: The primary intent of the 1991 survey was to record removals of grapes since the 1990 harvest and new planting of grapes during 1991. Acreage abandoned in 1991 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1990 and 1991 harvests.

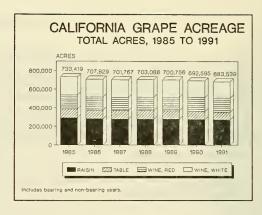

ACREAGE BREAKDOWN

California's 1991 total grape acreage is estimated at 684,750 acres. This estimate is down 8,877 acres from the 1990 total of 693,627 acres. Wine type grapes totaled 326,666 acres, down 3,690 acres from the 1990 acreage of 330,356. Wine type grapes represent 47.7 percent of the total grape acreage. Raisin type varieties totaled 273,576 acres, down 3,331 acres from 1990. Raisin type grapes account for 39.9 percent of the total grape acreage. Table type grapes totaled 83,297, down 2,035 acres from last season. Table type grapes account for 12.2 percent of the total grape acreage. The rootstock total is 1,211 acres, approximately 0.2 percent of the grape acreage for the State.

Fresno County continues to lead the State in total planted grapes and raisin type grapes with 205,084 acres and 163,776 acres, respectively. Tulare and Kern counties lead in table type grapes planted with 22,930 acres and 22,965 acres, respectively. These two counties account for 55 percent of total table grape acreage. San Joaquin County remains the leader in red wine type grapes with 22,783 acres. Madera County continues to lead white wine type grapes with 24,428 acres. (See illustration next page.)

Thompson Seedless grapes, estimated at 263,693 acres, continue to represent over 96 percent of the raisin type grapes. Fresno County dominates raisin type grapes with 60 percent of the acreage. Flame Seedless grapes totaled 25,281 acres, which is the largest table variety. Zinfandel and Cabernet Sauvignon are the leading red wine grapes with 34,369 acres and 34,176 acres, respectively. These two varieties account for 46 percent of the red wine type grapes planted in the State. Chardonnay has surpassed French Colombard as the leading white wine variety 56,609 to 55,839 acres, respectively.

Total removals for the 1990-91 season were 17,571 acres. Thompson Seedless again had the most acreage removed with 3,878 acres. French Colombard was the second largest variety pulled out with 2,656 acres. Kern County led the State in removals with 4,027 acres. Total graftings for the 1990-91 season were 3,434 acres, down 14 percent from last season. Eighty-four percent of these vines were grafted over to wine varieties.

ACREAGE TRENDS

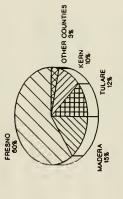

Raisin type grapes decreased a total of 3,331 acres from last year. The major varietal changes include a decrease of 3,565 acres for the Thompson Seedless variety and Muscat of Alexandria, down 169 acres. Fiesta is up 278 acres and the Black Corinth variety is up 172 acres.

Table type grapes decreased 2,035 acres. Most of this decline can be attributed to the following five varieties: Flame Tokay with a loss of 2,311 acres; Ribier declining 401 acres; Calmeria and Emperor with declines of 340 and 238 acres, respectively; and Exotic with a loss of 212 acres. Counteracting this overall decline was an increase of 849 acres in Redglobe grapes and a smaller increase of 212 acres for the Flame Seedless variety.

Red wine type grapes decreased a total of 743 acres from last year. Varieties with the largest declines were Carignane 816; Grenache 556; Barbera 423; and Rubired 346. Two varieties that had increased acreage were Cabernet Sauvignon at 970 and Merlot at 753 acres.

White wine type grapes decreased by 2,947 acres from 1990. Varieties showing declines include French Colombard 3,049; Chenin Blanc 2,085; and White Riesling 804. The Chardonnay variety increased the most, up 4,452.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by special assessment of the Wine industry, the California Raisin Advisory Board, and the California Table Grape Commission. The enumeration of grape acreages in Napa and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

Parcel records for California's fruit and nut crops are maintained by CASS. Updates are made to the CASS database as information is received from on-going surveys, County Agricultural Commissioners and CASS County Fruit Acreage surveys.

Questionnaires were mailed to approximately 7,800 operators having slightly over 15,000 grape acreage parcels. Only operators with five or more acres of grapes received a questionnaire. Each questionnaire was computergenerated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. They were also asked to report the intended removals between the time of their report and the 1993 harvest. If the questionnaire was not returned by mail, the information was obtained by telephone or personal interview.

May 1993

DATA LIMITATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for the three grape types (raisin, table, and wine). Less precision exists in the county data for minor varieties.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

BEARING AND NON-BEARING ACREAGE: For purposes of this publication, all varieties are considered non-bearing for 3 years; i.e., acres planted in 1989 would not be bearing until 1992. The only exception is Flame Seedless table grapes in Riverside County where drip irrigation is used. As a result, these grapes bear substantially in the second year. Some varieties in other areas produce a crop after 2 non-bearing years, but production is not large enough to consider as full bearing.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1992 onto a 1975 variety is recorded as planted in 1991. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

RAISIN INDUSTRY DIVERSION PROGRAM: In 1991 and 1992 the Raisin Administrative Committee administered the Raisin Industry Diversion Program. This program allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a crop.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1992. Acreages for all other varieties are combined in "Other" categories. Data are shown individually for 90 varieties including 52 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

Footnote c/ on page 31 lists synonymous varietal names.

<u>ROOTSTOCK</u>: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1989 rootstock planting was budded over in 1991, the year of planting assigned to the selected variety was 1990. (See the above paragraph on graftings.)

<u>PERIOD COVERED</u>: The primary intent of the 1992 survey was to record removals of grapes since the 1991 harvest and new planting of grapes during 1992. Acreage abandoned in 1992 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1991 and 1992 harvests.

ACREAGE BREAKDOWN

California's 1992 total grape acreage is estimated at 684,546 acres. This estimate is virtually unchanged from the 1991 total of 684,750 acres. Raisin type grapes totaled 273,217, table type 83,747, and wine type 326,670 acres. Each type is virtually unchanged from 1991 totals. Raisin type varieties accounted for 39.9, table type 12.2, wine type 47.7, and rootstock at 912 acres, 0.2 percent of the total grape acreage for the state.

Fresno County continues to lead the State in total planted grapes and raisin type grapes with 204,559 and 163,619 acres, respectively. Kern and Tulare counties lead in table grapes planted with 23,977 and 23,593 acres, respectively. These two counties account for 57 percent of total table grape acreage. San Joaquin County remains the leader in red wine type grapes with 22,372. Madera County continues to lead white wine type grapes with 24,559 acres.

Thompson Seedless grapes, estimated at 263,621 acres, continue to represent over 96 percent of the raisin type grapes. Fresno County dominates raisin type grapes with 60 percent of the acreage. Flame Seedless grapes totaled 26,874 acres, which is the largest table variety. Cabernet Sauvignon and Zinfandel are the leading red wine grapes with 34,567 and 34,142 acres, respectively. These two varieties account for 46 percent of the red wine type grapes planted in the State. Chardonnay is the leading white wine variety at 59,971 acres.

Total removals for the 1991-92 season were 11,304 acres. Thompson Seedless again had the most acreage removed with 2,096 acres. Flame Tokay was the second largest variety pulled out with 950 acres. San Joaquin County led the State in removals with 2,386 acres. Total graftings for the 1991-92 season were 2,531 acres, down 26 percent from last season. Two-thirds of the vines were grafted to wine varieties, 51 percent were wine grafted to a new wine variety and 18 percent were table or raisin types grafted over to wine type.

ACREAGE TRENDS

Raisin type grape bearing acreage declined little. Thompson Seedless bearing acres have been reduced by 692 acres and Muscat of Alexandria bearing acres declined by 451 acres. This was offset by an additional 621 bearing acres in the Fiesta variety and 227 more bearing acres in the Black Corinth variety.

Table type grapes increased 1,559 bearing acres. Flame Seedless increased 2,067 and Redglobe increased 1,418 bearing acres. Flame Tokay declined 1,124 and Emperor 1,013 bearing acres.

Bearing acres for red wine type grapes were up by 4,534. Cabernet Sauvignon, Merlot, and Zinfandel increased by 3,047, 1,493, and 1,340 bearing acres, respectively.

White wine type grapes increased by 903 bearing acres. Chardonnay was the main variety with an additional 4,656 bearing acres. French Colombard and Chenin Blanc led the declines with 1,668 and 1,566 less bearing acres, respectively.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by special assessment of the Wine industry, the California Raisin Advisory Board, and the California Table Grape Commission. The enumeration of grape acreage in Fresno, Napa, and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

Parcel records for California's fruit and nut crops are maintained by CASS. Updates are made to the CASS database as information is received from on-going surveys, County Agricultural Commissioners and CASS County Fruit Acreage surveys.

Questionnaires were mailed to approximately 7,800 operators having slightly over 15,000 grape acreage parcels. Only operators with five or more acres of grapes received a questionnaire. Each questionnaire was computer-generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. If the questionnaire was not returned by mail, the information was obtained by telephone or personal interview. A complete survey of all land in Fresno County for fruit and nut acreage data was conducted in 1993. Grape acreage data from that survey was included in this report.

May 1994

DATA LIMITATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for the three grape types (raisin, table, and wine). Less precision exists in the county data for minor varieties.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND NON-BEARING ACREAGE</u>: For purposes of this publication, all varieties are considered non-bearing for 3 years; i.e., acres planted in 1990 would not be bearing until 1993. The only exception is Flame Seedless table grapes in Riverside County where drip irrigation is used. As a result, these grapes bear substantially in the second year. Some varieties in other areas produce a crop after 2 non-bearing years, but production is not large enough to consider as full bearing.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1993 onto a 1975 variety is recorded as planted in 1992. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

<u>RAISIN INDUSTRY DIVERSION PROGRAM</u>: In 1991, 1992, and 1993 the Raisin Administrative Committee administered the Raisin Industry Diversion Program. This program allowed growers of raisin type grapes to receive payment in kind if acreage was either removed or the vines were pruned so that they were unable to produce a crop.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1993. Acreage for all other varieties are combined in "Other" categories. Data are shown individually for 95 varieties including 54 wine types. Care was taken to properly identify each block reported with a recognized varietal name.

Footnote c/ on page 31 lists synonymous varietal names.

<u>ROOTSTOCK</u>: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1991 rootstock planting was budded over in 1993, the year of planting assigned to the selected variety was 1992. (See the above paragraph on graftings.)

<u>PERIOD COVERED</u>: The primary intent of the 1993 survey was to record removals of grapes since the 1992 harvest and new planting of grapes during 1993. Acreage abandoned in 1993 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis. Removal data pertains essentially to the period between the 1992 and 1993 harvests.

ACREAGE BREAKDOWN

California's 1993 total grape acreage is estimated at 697,792 acres. This estimate is up 13,246 acres from the 1992 total of 684,546 acres. Raisin type variety grapes totaled 281,300, up 8,083 acres from the 1992 total; table type 82,814, down 933 acres from last season; and wine type 332,702 acres, down 6,032 from 1992. Raisin type varieties accounted for 40.3, table type 11.9, wine type 47.7, and rootstock at 976 acres, 0.1 percent of the total grape acreage for the State.

Fresno County continues to lead the State in total planted grapes and raisin type grapes with 215,820 and 170,827 acres, respectively. Kern and Tulare counties lead in table grapes planted with 23,663 and 23,460 acres, respectively. These two counties account for 57 percent of total table grape acreage. San Joaquin County remains the leader in red wine type grapes with 23,286. Madera County continues to lead white wine type grapes with 24,416 acres.

Thompson Seedless grapes, estimated at 270,330 acres, continue to represent over 96 percent of the raisin type grapes. Fresno County dominates raisin type grapes with 61 percent of the acreage. Flame Seedless grapes totaled 27,510 acres, which is the largest table variety. Zinfandel and Cabernet Sauvignon are the leading red wine grapes with 35,341 and 34,933 acres, respectively. These two varieties account for 45 percent of the red wine type grapes planted in the State. Chardonnay is the leading white wine variety at 62,701 acres.

Total removals for the 1992-93 season were 8,590 acres. Thompson Seedless again had the most acreage removed with 943 acres. Chardonnay was the second largest variety pulled out with 928 acres. Napa County led the State in removals with 1,460 acres. Total graftings for the 1992-93 season were 1,843 acres, down 27 percent from last season. Approximately 88 percent of the vines were grafted over to wine varieties.

ACREAGE TRENDS

Raisin type variety grape bearing acreage increased by 5,366 acres, with the Thompson Seedless variety accounting for 5,127 of those acres.

Table type variety grapes increased 762 bearing acres. Redglobe increased 1,226, Flame Seedless increased 977, and Ruby Seedless increased 558 bearing acres. Flame Tokay declined 936 and Emperor 810 bearing acres.

Bearing acres for red wine type grapes were up by 5,144. Cabernet Sauvignon, Merlot, and Rubired increased by 2,644, 1,380, and 808 bearing acres, respectively.

White wine type grapes increased by 2,653 bearing acres. Chardonnay was the main variety with 4,613 additional bearing acres. Chenin Blanc, White Riesling, and Sauvignon Blanc led the declines with 1,140, 406, and 395 less bearing acres, respectively.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Financial support was provided by special assessment of the Wine industry and the California Table Grape Commission. The enumeration of grape acreage in Napa, and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

Parcel records for California's fruit and nut crops are maintained by CASS. Updates are made to the CASS database as information is received from on-going surveys, County Agricultural Commissioners and CASS County Fruit Acreage surveys.

Questionnaires were mailed to approximately 9,000 operators having slightly over 15,000 grape acreage parcels. Only operators with five or more acres of grapes received a questionnaire. Each questionnaire was computer-generated with the current database information listing of variety(ies), year(s) of planting, number of vines, acreage, etc. Operators were asked to note any corrections, including removals, new plantings, graftings, change of ownership or operator, etc. If the questionnaire was not returned by mail, the information was obtained by telephone or personal interview. Approximately 50 percent of the grape questionnaires were received by mail. The wine and table grape growers who did not respond were contacted by phone or personal visit. Funding was not available from the raisin industry this year. No attempt was made to obtain data from raisin grape growers that did not respond to the mail request.

May 1995

DATA CLARIFICATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for wine and table grape types. Less precision exists in the county data for minor varieties. Reliability of table and wine grape data is comparable to previous years; readers are cautioned that raisin grape information is less reliable. Detailed raisin grape statistics are not being published.

Beginning with this report, total (bearing plus non-bearing) grape acreage in the ground in the fall of 1993 is published alongside of the 1994 data.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND NON-BEARING ACREAGE</u>: For purposes of this publication, all varieties are considered non-bearing for 3 years; i.e., acres planted in 1991 would not be bearing until 1994. The only exception is Flame Seedless table grapes in Riverside County, which are of bearing age after two years.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1994 onto a 1975 variety is recorded as planted in 1993. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1994. Acreage for all other varieties are combined in "Other" categories. Care was taken to properly identify each block reported with a recognized varietal name. Beginning with this report the **Muscat of Alexandria** variety is included under white wine varieties instead of raisin grape varieties.

Footnote 3/ on page 45 lists synonymous varietal names.

<u>ROOTSTOCK</u>: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1992 rootstock planting was budded over in 1994, the year of planting assigned to the selected variety was 1993. (See the above paragraph on graftings.)

<u>PERIOD COVERED</u>: The primary intent of the 1994 survey was to record removals of grapes since the 1993 harvest and new planting of grapes during 1994. Acreage abandoned in 1994 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis.

GRAPE CRUSH DISTRICTS: For the first time, grape acreage is being published by grape crush districts (see Table 10). A map and description of those districts is located on the inside front cover.

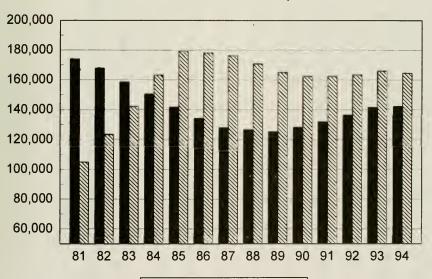

ACREAGE BREAKDOWN

California's 1994 total grape acreage is estimated at 707,689 acres. This estimate is up 9,514 acres from the 1993 total of 698,175 acres. Raisin type variety grapes totaled 278,558 acres. Beginning with the 1994 crop, Muscat of Alexandria variety grapes (5,230 acres) are under white wine type grapes instead of raisin type grapes. Raisin type varieties account for 39.4 percent of the total grape acreage. Table type grapes totaled 83,941, up 1,081 acres from last season. Table type grapes represent 11.9 percent of the total grape acreage. Wine type grapes totaled 344,260 acres. Wine type grapes represent 48.6 percent of the State's grape acreage. The rootstock total is 930 acres, approximately 0.1 percent of the grape acreage total.

Bearing acreage of red wine type grapes increased slightly. The largest wine bearing acreage increases occurred in Chardonnay, Merlot, and Zinfandel. Decreased bearing acreage included the French Colombard and Chenin Blanc varieties.

Table type grape bearing acreage decreased slightly. Flame Tokay, Emperor, and Perlette were among the varieties with declining acres, with Redglobe and Flame Seedless increasing the most.

ACKNOWLEDGEMENTS

This Survey was again undertaken at the request of the Grape Industry. Funding was provided by an assessment on wine grapes plus funding from the California Table Grape Commissiion and the Raisin Administrative Committee. The enumeration of grape acreage in Napa, and Sonoma counties by personnel in the County Agricultural Commissioners' offices is appreciated and worthy of special attention. We also extend sincere appreciation to farm owners and operators who provided information on their individual operations. Cooperation from all contributors is greatly appreciated. Finally, a special thanks goes to the office personnel and field enumerators whose efforts and diligence makes this report possible.

FOREWORD

Since 1969, the California Agricultural Statistics Service (CASS) has recorded current acreage statistics for the California grape industry. In the late 1960's and early 70's, the major concern of the industry was the magnitude of new plantings, especially of premium varietals, in areas which up to that time had not been major grape growing regions. Of additional concern was acreage increases in already established areas. Between 1969 and 1974, total grape acreage increased by 36 percent while wine grape acreage alone increased by 118 percent. Grape acreage publications showing varietal and geographic changes have been available on an annual basis since 1971.

SURVEY METHODS

California Agricultural Statistics Service (CASS) maintains a grape acreage data base which served as the main source for questionnaire mailing. Growers on this data base were sent a questionnaire with previous reported, variety, number of vines and acreage. Recipients were asked to update the information. The CASS data base was also compared to the California Department of Pesticide Regulations (DPR). Growers not included in CASS's data base were sent a blank questionnaire and asked to provide specific information on their grape acreage. More than 16,000 parcel records were mailed to over 8,000 grape growers. Overall, more than 97 percent of the parcels were completed. Approximately 56 percent of the parcels were returned by mail, 35 percent by telephone, and 9 percent by personal interview.

June 1996

DATA CLARIFICATIONS

<u>GENERAL</u>: This report provides acreage data at several levels of detail. Users should be cautioned that the figures at the finest level of detail are less precise than the aggregate level data. The highest level of precision will be found at the state level for all grapes and for the three grape types (raisin, table, and wine). Less precision exists in the county data for minor varieties.

In most cases, the information was acquired from the vineyard operator. If the operator could not be reached, every effort was made to contact a source such as a nonresident owner or relative that could be expected to have definite knowledge of the operation. Only in a few instances was it necessary to visit the block and draw conclusions independently.

All reported data were carefully reviewed. Incomplete or questionable reports were resolved by secondary contact with the respondent.

<u>BEARING AND NON-BEARING ACREAGE</u>: For purposes of this publication, all varieties are considered non-bearing for 3 years; i.e., acres planted in 1992 would not be bearing until 1995. The only exception is Flame Seedless table grapes in Riverside County, which are of bearing age after two years.

<u>GRAFTING</u>: Graftings on bearing acres are recorded as planted in the previous year; i.e. Chardonnay grafted in 1995 onto a 1975 variety is recorded as planted in 1994. This assumes that grafted vines will actually bear a full crop in two years as opposed to three years for a newly planted vine.

<u>VARIETIES</u>: Data are provided for each variety with 50 or more total acres standing in 1995. Acreage for all other varieties are combined in "Other" categories. Care was taken to properly identify each block reported with a recognized varietal name.

Footnote 3/ on page 47 lists synonymous varietal names.

ROOTSTOCK: Most of the rootstock shown was planted in the past three years. However, some earlier plantings are included. When rootstock was budded over, the year of planting assigned to that block of grapes was the year preceding the budding. For instance, if a 1993 rootstock planting was budded over in 1995, the year of planting assigned to the selected variety was 1994. (See the above paragraph on graftings.)

<u>PERIOD COVERED</u>: The primary intent of the 1995 survey was to record removals of grapes since the 1994 harvest and new planting of grapes during 1995. Acreage abandoned in 1995 was excluded from bearing acreage. Planting activity is accounted for on a calendar-year basis.

<u>GRAPE CRUSH DISTRICTS</u>: Grape acreage data is also being published by grape crush districts (see Table 12). A map and description of those districts is located on the inside front cover.

ACREAGE BREAKDOWN

California's 1995 total grape acreage is estimated at 718,743 acres. This estimate is up 11,055 acres from the 1994 total of 707,688 acres. Raisin type variety grapes totaled 277,190 acres. Raisin type varieties account for 38.6 percent of the total grape acreage. Table type grapes totaled 85,539, up 1,598 acres from last season. Table type grapes represent 11.9 percent of the total grape acreage. Wine type grapes totaled 354,417 acres. Wine type grapes represent 49.3 percent of the State's grape acreage. The rootstock total is 1,597 acres, approximately 0.2 percent of the grape acreage total.

Bearing acreage of red wine type grapes increased 1,020 acres, while white wine bearing acres decreased 7,187 acres. The largest wine bearing acreage increases occurred in Chardonnay, Merlot, and Zinfandel. Decreased bearing acreage included the French Colombard and Chenin Blanc varieties.

Table type grape bearing acreage decreased 1,543 acres. Flame Tokay, Emperor, and Perlette were among the varieties with declining acres, with Redglobe and Flame Seedless increasing the most.
